Executive summary

AI (Artificial Intelligence) is transforming organisation decision-making process easier and helping everyone in their organisation work and more technical work. As growing organisations have more demand in the field of AI, which also increases the challenges and ongoing risks related to the privacy, transparency, bias, accountability, security, and other regulatory compliance. The NIST AI Risk Management Framework (AI RMF), ISO/IEC 42001, the European Union AI Act, and the Australian Government's Guidance for AI Adoption are just a few of the many AI governance frameworks that are available. However, organisations frequently find it difficult to decide which framework, or combination of frameworks, best fits their operational, legal, and ethical requirements. The Assessment 1 evidence assessment and gap analysis, which discovered a dearth of useful advice for choosing and using AI governance frameworks within the Australian corporate environment, highlighted this difficulty.

The project proposes the development of AI Governance Framework Evaluation model to support Australian organisation in comparing and implementing AI governance frameworks based on the company or organisation objectives. The Project will also adapt a DSR (Design Science Research) methodology to design develop and evaluate the model. The evidence will be collected from the peer-reviewed literature and international standards with governance guidance. The project will also cooperate with sustainability, recognised ethical, privacy and responsible ai principles to align with professional and regulatory expectations.

A useful decision-support model that helps Australian firms implement responsible AI governance while lowering compliance complexity, enhancing organisational responsibility, bolstering risk management procedures, and encouraging reliable AI adoption is the anticipated result. In accordance with the goals specified in the project charter and the assessment standards, the proposal requests permission to move forward with the design, development, and evaluation of this model during Part B of the capstone project.

Introduction

As AI is rapidly developing in the today's world in the organisations, I have given to choose a specific organisation to narrow the field and to choose what are to be expected in that field with the broad view. AI has become an important component for the university and the higher education sector transforming how universities deliver their services more efficiently. AI have helped in the sector like managing administrative research, operations, teaching and supporting student learning. Australian universities are constantly introducing ai powered technologies for personalised learning and teaching processes. However, institutions frequently struggle to decide which framework best serves their institutional goals or how to successfully integrate various frameworks in higher education settings. Therefore, this comparative ai governance model is especially designed for Australian universities and higher education sectors. In order to help university administrators, IT governance experts, risk managers, and politicians determine the best governance approach for responsible AI deployment, the model will examine top international and Australian AI governance frameworks using uniform evaluation criteria. The proposal provides a thorough execution pathway for Part B of the capstone project by outlining the project's evidence foundation, methodology, implementation plan, ethical concerns, risk management strategy, stakeholder engagement approach, and anticipated outcomes.

Evidence Review and Gap Analysis

NIST AI RMF uses Govern, Map, Measure, and Manage to organise organisational operations. An AI management system designed to function continuously rather than as a one-time evaluation is established by ISO/IEC 42001. While Australian guidelines offer implementation methods for responsible organisational adoption, the EU AI Act imposes legislative duties on certain risk categories.

Effective Governance is important which will help us to balance not by choosing between difference forces and stacking them based on the risk. Effective Governance also helps to establish mandatory, organisation level foundation of the general frameworks and the security. By keeping early-stage, low-risk areas open to adaptable, voluntary, and innovation-focused approaches, it safeguards technological advancement in the meantime. In the end, this hybrid matrix guarantees that regulatory certainty and public safety provide a non-negotiable floor, but flexible results give businesses the freedom to scale and modify technical controls without being constrained by inflexible, antiquated bureaucracy.

Theme01:

Risk-Based Governance and AI lifecycle Management

In this research, it demonstrates that the governance failures rarely result from the absence of ethical principles. Risk is determined by its magnitude and how it is categorised, quantified, and managed. Risk must be certain, or rather, the assumption of risk must be acceptable so that we have time to counter if an organization faces a particular threat. In addition to user-based risk and lifecycle-oriented approaches, modern AI governance is growing quickly. First, we must find the

vulnerability in the ai and should have the measure to counter these vulnerabilities which will help the organisation to counter any threat before it even reaches to the governance of ai. As for the Testing and Validation, continuous testing is required for the development of AI and for the development of a company. After testing the validation is required to cope with ongoing market demand. Because AI systems are always evolving due to new datasets, shifting academic policies, and ongoing student interactions, lifecycle governance is especially crucial for universities. Therefore, ongoing monitoring is necessary for effective governance as opposed to one-time compliance evaluations.

By encouraging institutional leadership and risk ownership. Because AI systems are always evolving due to new datasets, shifting academic policies, and ongoing student interactions, lifecycle governance is especially crucial for universities. Therefore, ongoing monitoring is necessary for effective governance as opposed to one-time compliance evaluations.

Theme02:

Accountability, assurance and organisational implementation

Nobody knows what would happen if something went wrong with AI, and who would be responsible? It is among the most significant flaws in AI governance. For any AI company, accountability is crucial, as is the decision of who will buy AI and all the associated guarantees. AI governance may not be a lack of preexisting principles, but rather a lack of organisational capacity to apply them consistently. NIST AI RMF advances governance duties.

An ethical AI is crucial for organisational AI governance in order to ensure compliance and support the organization's growth. Organisational AI governance is a collection of rules, policies, procedures, and technological tools intended to ensure that AI supports business strategies, objectives, and values while abiding by legal and ethical requirements. Furthermore, research indicates a deficiency in empirical knowledge on the operationalisation of governance in companies. While Papagiannis and colleagues investigate AI-governance strategies, obstacles, and organisational results, Birkstedt and colleagues consider training, stakeholder involvement, senior management commitment, and company culture as critical governance aspects.

Theme03

Evaluation from AI ethics principles to operational governance

Operational governance is crucial to an AI's operation and performance to ensure that every employee will benefit from it and that all staff members receive equitable training. Mittelstadt contends that as AI development lacks clear professional responsibilities, implementation strategies, and accountability frameworks, principles by themselves cannot ensure ethical AI. The challenge of shifting from the "what" of ethics to the "how" of implementation is also examined by Morley and colleagues.

According to the evidence, various frameworks have different legal statuses, implementation requirements, and operational complexity even though they aim to achieve comparable goals, such as AC justice, openness, privacy protection, human oversight, and accountability. In order to avoid needless duplication or compliance difficulties, universities need governance strategies that can integrate numerous frameworks.

Gap Analysis

Assessment 1 have identified a gap between existing AI governance frameworks and their practical application or standards with Australian Universities. I will now go over the gap analysis based on the tool-selection reasoning and the reasons generic SWOT analysis is inappropriate. This paper focuses on the systematic assessment of AI governance tools rather than poor organisational strategy. Limited sector-specific guidelines, uneven execution, and scattered adoption are characteristics of current governance techniques. Universities often adopt components of several frameworks on their own, which leads to ambiguous accountability structures, inconsistent risk management procedures, and redundant governance processes.

We are going to choose two frameworks, such as

1. Comparative Evaluation Matrix
2. As-Is/ To-Be gap Analysis

First Framework: Comparative Evaluation Matrix

Evaluation Criterion	NIST AI RMF	ISO/IEC 42001	EU AI Act	Australian guidance
----------------------	-------------	---------------	-----------	---------------------

Legal status	Voluntary Framework	Voluntary Certifiable International Standard	Binding Law with Extraterritorial Effect	Layered: Voluntary for private sector (6 Essential Practices); Mandatory for federal public sector (DTA Policy)
Human Oversight	Recommended core function trait under the Manage and Govern profiles.unction trait under the Manage and Govern profiles.	Explicit operational control requirement (Annex A.8) built into the AIMS framework.	Mandated legally; requires continuous human-in-the-loop override capabilities for high-risk tiers.	Explicitly mandated via Essential Practice 6 ("Maintain human control") and mandatory DTA use-case rules.
Risk-based approach	Four-part core architecture structured entirely around identifying, parsing, and controlling risk (Govern, Map, Measure, Manage).	Context-driven; requires establishing an AI risk assessment and treatment process aligned with organizational tolerance.	Rigid, statutory classification system dividing applications into Unacceptable, High, Limited, and Minimal Risk tiers.	Proportional, risk-based approach; mandates higher validation thresholds and impact assessments for high-impact use cases.
Transparency	Promotes disclosure, transparency, and explainability as core characteristics of trustworthy AI systems.	Requires documented information controls, system logging, and clear communication channels with external stakeholders.	Strict statutory rules mandating clear end-user notices, technical documentation, and watermarking of synthetic content.	Mandated via Essential Practice 4 ("Share information") and legal disclosure deadlines for automated decision-making using personal data.
Audit or certification	Non-certifiable framework; acts as a self-assessment and	Fully certifiable by independent third-party registrars under	Mandatory conformity assessments and third-party audits	No native domestic certification scheme; relies on

	playbook resource.	international accreditation rules (ISO 42006).	required for high-risk classifications before market entry.	existing regulators (OAIC, ACCC, ASIC) and voluntary standard alignment.
Testing and Monitoring	Addressed directly within the Measure function, emphasizing continuous metrics validation.	Evaluated via continuous improvement loops, periodic performance metrics, and formal management reviews.	Rigorous post-market monitoring and mandatory post-market surveillance plans tied to legal reporting gates.	Enforced through Essential Practice 5 ("Test and monitor"), requiring pre-deployment gates and production tracking.
Privacy and data governance	Deep focus on privacy-enhancing techniques, data minimization, and secure data pipelines across the lifecycle.	Structured clauses (Annex A Controls A.8.5/A.8.6) tracking data provenance, data quality, and secure processing.	Restricts high-risk training datasets, enforces strict data governance protocols, and mandates compliance with GDPR.	Co-dependent on the Australian Privacy Principles (APPs); heavily shaped by new statutory automated decision transparency rules.
Incident Management	Integrated into the Manage function to respond to, contain, and recover from unexpected AI failures.	Explicit control requiring structured detection, reporting, investigation, and correction of security or algorithmic incidents.	Explicit control requiring structured detection, reporting, inMandatory, time-sensitive reporting of serious incidents or malfunctions directly to the European AI Office.	Handled via existing sector-specific mechanisms (e.g., APRA CPS 230/234) and structured DTA public-sector reporting rules.
Primary Audience	Global enterprise risk teams, data scientists, and technical software developers.	Organizations of any size looking to certify an AI Management System (AIMS) across a B2B supply chain.	Providers, developers, importers, and downstream deployers operating within	Australian private corporations, small-to-medium enterprises (SMEs), and Commonwealth

			or supplying the EU market.	public sector agencies.
Australian Suitability	High; serves as an exceptional cross-border interoperability engine for mapping technical system controls.	High; rapidly becoming the preferred certifiable procurement asset requested by local enterprise buyers.	Low-Medium; highly burdensome and only operationally necessary for Australian firms exporting directly to the EU market.	Maximum; natively tailored to local market scale, economic structures, and domestic technology-neutral laws.

Framework 2: As-Is/ To-Be Analysis

This is a framework 2 for that gap analysis, where I am going to talk about two state those are Current State and Desired State

Current state:

1. Current guidance focuses on general organisation rather than higher sectors
2. University adopt AI governance frameworks alone with limited integration
3. there are different factors lacks with the one being decision making

Desired State:

1. Ethical, privacy, security, and sustainability requirements are incorporated into a unified governance strategy.
2. Governance practices are standardised across teaching, research, and administration.
3. Framework selection aligns with institutional objectives, legal obligations, and risk profiles.

The Gap Matrix (Level Metrics)

Gaps	Current Level	Target Level
In AI risk Management	low	Advanced
In Transparency and explainability	Advanced	Advanced

Problem Statement

The evidence shows that there are still issues with prescriptive localised implementation metrics, accessibility for small-to-medium enterprises (SMEs), and practical cross-framework alignment. However, existing AI governance frameworks collectively address high-level trustworthy characteristics, operational lifecycle mapping, and structured socio-technical risk assessments. This makes it challenging for Australian companies to proactively move from simple, disjointed compliance postures to sophisticated, all-encompassing risk management without stifling operational flexibility and duplicating technical infrastructure. Thus, the project opportunity is to create and assess a Comparative AI Governance Framework Evaluation Model that gives Australian businesses a context-sensitive decision matrix to strategically choose, combine, and implement both domestic and international AI safeguards.

Higher education institutions in Australia today function within a complicated governance framework. When participating in international research collaborations, universities must take into account international standards like the NIST AI Risk Management Framework (AI RMF), ISO/IEC 42001, and, in certain situations, the European Union AI Act in addition to domestic regulations like the Australian Privacy Principles (APPs). To solve that issue, this project suggests creating a Comparative AI Governance Framework Evaluation Model that is especially suited to Australian universities and other higher education establishments. Using uniform criteria pertaining to governance maturity, regulatory compliance, ethical responsibility, organisational readiness, and risk management, the model will make it possible for institutional leaders, IT governance experts, compliance managers, and legislators to methodically assess top AI governance frameworks.

Project Aim and SMART Objectives

The primary aim of my project is to design and develop a comparative AI governance framework that assist Australian universities and the higher education about implementing and comparing the appropriate ai governance frameworks for responsible AI adaptation. There is different model that will be leading the governance frameworks such as:

1. Iso/IEC 42001
2. European Union AI Act
3. NIST AI RMF
4. Australian Government Guidance for AI Adaptation

My project seeks to improve in university and in the higher institutions for the decision-making by providing a evidence- based decision support tools that will help to strengthens the ai governance. This will also help to enhance the regulatory, promotes ethical ai practices, compliance, and reduces the governance complexity.

SMART Objectives

There are 4 objectives in my project and they are as below:

Objective 01: Week04	Conduct a comprehensive literature review	In this, I'm conducting a systematic review for the peer-reviewed literature and international standards and Australian Government Publications.
Objective 02: Week 07	Develop the comparative Evaluation Model	In this, I'm going to design a structured evaluation models that will help to compare with major AI frameworks including risk management, transparency, compliance and sustainability.
Objective 03: Week 09	Validate the proposed Model	Through comparative analysis and case-based application, I'm going to evaluate the proposed model with Australian higher education sectors to determine the complexity and consistency.
Objective 04: Week 12	Product Project Deliverables	This is the last phase, where I need to complete the complete report and submit the documentation with the clear evidence. GitHub repository, presentation materials and recommendations.

Proposed Solution

My model will assist the university leaders, IT managers, Governance committees and compliance officers about AI governance implementations. To address this AI governance with Australian universities and education institutions, this project proposes the development of the ai with the clear

outcome and who should be responsible and accountable for the use of this ai. Rather than creating continuously new AI governance frameworks we are going to stick with the same 4 Frameworks and create the most suitable and most essential frameworks for the university. There are different criteria that will help assess governance frameworks which is relevant to Australian higher education. Some of them are as follows:

1. Regulatory and legal compliance
2. sustainability and long term ai governance capability
3. Ethical AI principles
4. Transparency and accountability
5. Privacy and data protection
6. Cybersecurity and information security
7. Human oversight
8. AI risk management and lifecycle governance

With combining these different framework criteria will be able to get the best possible outcome and best align with their strategic goals and operational requirements.

Expected benefits

The proposed solution will also bring some benefits to help Australian Universities and higher education institutions.

1. Encourages the stronger ai governance strategies
2. Enhances the organisational governance maturity.
3. Strengthen Transparency, Accountability and ethical AI principles
4. Improves the compliance with Australian privacy and regulatory requirements

Research Methodology

Research Method

In this project I'm going to adapt DSR methodology to develop and evaluate a comparative AI Governance framework for Australian Universities.

Fig (1): DSR process for developing the comparative AI Governance framework Evaluation model

In this research method, there is a multi-phase development pathway for Australian University for AI Governance evaluation model. In here first it will identify the problem and then give the final research outcome.

Research Design

My project will flow a qualitative approach for the secondary data analysis. Instead of collecting data from different sources, we will be collecting from:

1. Industry reports
2. Professional guidelines
3. International AI governance standards
4. peer-reviewed academic journals
5. Case studies relating to AI

The project will be focusing in evaluating and comparing these frameworks rather than developing new frameworks.

Research Process

In my project we will be going through five completed frameworks sequentially:

Phase1: Literature review

Phase2: Framework Identification

Phase3: Development of Evaluation Criteria

Phase4: Comparative Framework Evaluation

Phase5: Validation and Recommendations

We all know how these frameworks will be working and these are 5 completely different frameworks and would be most important for my project.

Research methodology Framework

Fig (2): Overall Research Methodology adopted for this project

As for the research methodology, we will be conducting our research in different methodology as mentioned in the above diagram.

Project Conceptual Frameworks

Fig (3): Conceptual framework of the proposed Comparative AI Governance Framework Evaluation Model.

This figure represents the research frameworks and how all these frameworks will be working along with their components and how they are managed. As you can see in above figure each frameworks have their own components.

Project Plan

The project plan will defines the schedule, resources, management approach and schedule is required to successfully develop the project based on the Australian Standards. The project will be consists of five major work packages such as:

1. Project initiation and planning
2. Literature review and evidence collection
3. AI governance framework analysis
4. Evaluation model development and validation
5. Final documentation and submission

Work Breakdown Structure

WBS	Task	Description	Output
1	Project Initiation	Define scope, objectives and research	Project charter
2	Literature review	Reviewing AI governance research	Literature review
3	Framework Analysis	Evaluating Existing AI Frameworks	Framework Comparison
4	Model Development	Create evaluation Model	Prototype model
5	Documentation	Prepare final report and submission	Final Report

WBS Diagram

Fig (4): Work Breakdown Structure

Gantt Chart Summary

Fig (5): Project Gantt Chart

Key Project Milestones

Milestone	Description	Completion Week
M1	Project scope and objectives approved	Week 1
M2	Literature review completed	Week 3
M3	AI governance frameworks selected	Week 4
M4	Evaluation criteria finalised	Week 6
M5	Comparative evaluation model developed	Week 8
M6	Validation completed	Week 9
M7	Final report submitted	Week 10

Critical Path

Resource Requirements

Human Resources

1. Student Researcher
2. Academic Supervisor
3. Academic and Industry Sources

Technical Resources

1. Microsoft Word
2. Microsoft Excel
3. GitHub
4. Reference Manager

Ethics, Privacy and Responsible AI Considerations

Fig (6): Responsible AI Evaluation Frameworks

Responsible AI requires organisations to consider ethical, legal and social implications throughout the cycle. My project completely focuses on evaluating AI governance frameworks targeting the universities and the higher education. Ethical considerations is the most important factor and a main

event for ensuring that the proposed model supports fair, transparent, secure and accountable ai implementation. Universities use ai for deep learning and creating their work easier for the most of their research. The model will support student services, automated assessment assistance, research analysis and administrative decision-making. This project will incorporate responsible AI principles from the recognised frameworks including transparency, fairness, human oversight and security.

Ethical Principles applied in the project

- 1. Accountability and governance responsibility
- 2. Transparency and explainability
- 3. Privacy and data protection
- 4. Fairness and Bias Management
- 5. Human Oversight
- 6. AI safety and Cybersecurity

Privacy Management Approach

- 1. Existing University AI policies
- 2. Academic publications
- 3. International standards
- 4. Government reports

Ethical Risks and Mitigation Strategies

Ethical Risk	Potential Impact	Mitigation Strategy
AI Bias	Unfair outcomes for students	Include fairness evaluation criteria
Privacy Breaches	Exposure of personal information	Apply privacy-by-design principles
Lack of Transparency	Reduced trust in AI systems	Require explainability mechanisms
Excessive Automation	Reduced human judgement	Maintain human oversight
Security Weaknesses	AI system compromise	Include cybersecurity assessment criteria

Ethical Contribution of the project

The proposed model contributes significantly to responsible AI adaptation by helping the universities by informing them about the governance decision before implementing the AI technologies. My model considers legal, ethical, privacy and social responsibilities.

Sustainability and social Impact

When developing the project, sustainability—specifically, its effects on the environment, society, and economy—was considered. The prototype is merely a simple static web application that may be used locally on a computer. It doesn't rely on cloud-based processing or train a big AI model. As a result, compared to a more sophisticated AI system, it should require less processing power, storage, and internet bandwidth. The project's social impact is primarily related to how organisations handle the application of GenAI. The framework does not advocate for businesses to outright prohibit AI tools because workers might still manage to utilise them without authorisation. It emphasises doable actions including staff coaching, defined roles, and access to authorised resources.

The project takes cost into account as well. Some smaller organisations might not have the funds, personnel, or time to implement all suggested controls right away. Because of this, the framework will indicate which areas, given the organization's risks and level of maturity, should be addressed first. This enables a company to start with the most important controls and gradually improve them. This strategy could lessen the possibility of data breaches, privacy difficulties, legal problems, and reputational harm to the company.

Stakeholder and communication plan

Stakeholder	Role/Interest	Level	Engagement Approach
University Leaders	Responsible for strategic AI adoption decisions	High	Project outcomes and governance recommendations
IT managers and Digital Teams	Manage AI systems and technical implementation	High	Evaluate governance controls
AI Governance committee	Monitor AI use	High	Review Framework Suitability
Regulators and Governments	Establish AI policies	Medium	Use regulatory standards
Student	User affected by ai services	Medium	Consider fairness, privacy and transparency concerns

Stakeholders have varying interests and levels of influence, so communication needs to be specific. The academic supervisor will get a structured weekly progress report and has significant control over scope and academic quality. During weeks seven and eight, cybersecurity and privacy reviewers—

who have medium to high influence over technical credibility—will receive a brief review pack, demonstration, and feedback form. The scope, confidentiality, and comprehensibility of the output will be the main points of contact with a potential pilot organization representative who has a strong practical interest but is not always available. Revisers who are end users will evaluate usability and clarity rather than legal accuracy.

Stakeholder power-interest matrix

Communication Plan

Communication Activity	Audience	Purpose	Frequency
Project progress updates	Academic Supervisor	Review progress and receive feedback	Weekly
Research findings review	Supervisor / Academic reviewers	Validate research direction	During milestones
Framework comparison updates	AI governance stakeholders	Present evaluation progress	Key project stages
Final report submission	University stakeholders	Present completed model and recommendations	End of project
GitHub documentation updates	Project reviewers	Maintain transparency and version history	Throughout project

Conclusions

Despite having similar principles like accountability, transparency, justice, privacy, and human oversight, these frameworks differ greatly in terms of implementation specifics, enforcement, and organisational application. One major obstacle is still the disconnect between high-level ethical principles and the real-world controls needed to apply them consistently. An evidence-based GenAI cybersecurity and privacy ready framework, a functional local prototype, and a recorded evaluation are all part of this proposal's focus and viability. Without posing as a compliance certificate, the artefact will transform various sources of guidance into quantifiable controls, evidence expectations, maturity gates, and prioritised improvement actions.

Appendix A

Updated Project Charter

Element	Updated charter content
Project title	Evaluating AI Governance for Australian Organisation (University and Higher Education)
problem	For employees to utilise external GenAI solutions, Australian SMEs and mid-sized businesses lack a quantifiable method to assess whether governance, cybersecurity, privacy, personnel, and supplier controls are sufficient.
Value proposition	Transform disjointed recommendations into an evidence maturity outcome, significant control gaps, and a plan for prioritised improvement.
In scope	Twenty questions, six domains, two hypothetical scenarios, four maturity stages, evidence cap, crucial gates, local browser prototype, expert review, and management report format
Out of scope	Legal counsel, certification, production deployment, provider penetration testing, model training, and enterprise launch
stakeholders	Academic supervisors, end-user reviewers, cybersecurity reviewers, privacy/governance reviewers, student/project leads, and possible organization representatives

Appendix B

Detailed Gantt Chart

Appendix C

Full Risk Register

Risk ID	Risk Category	Risk Description	Cause	Potential Impact	Likelihood	Impact Level	Risk Rating	Mitigation Strategy	Contingency Action
R1	Regulatory Risk	AI governance standards and regulations may change during the project lifecycle.	Rapid development of AI policies, standards, and legislation.	Evaluation criteria may become outdated and require revision.	High	High	High	Regularly monitor updates from NIST, ISO, Australian Government, OECD, and EU AI Act sources.	Update framework analysis and document regulatory changes as future improvements.
R2	Research Risk	Limited availability of peer-reviewed research specifically focused on AI governance in Australian universities.	AI governance is an emerging research area.	Reduced academic depth and limited evidence for evaluation criteria.	Medium	Medium	Medium	Use a combination of academic papers, government reports, international standards, and industry publications.	Replace weak sources with authoritative publications.
R3	Methodological Risk	Difficulty comparing AI governance frameworks due to different purposes and structures.	Frameworks focus on different areas such as risk management, compliance, or management systems.	Inconsistent comparison results and reduced reliability of evaluation outcomes.	Medium	High	High	Develop common evaluation criteria applicable across all frameworks.	Revise scoring methodology and justify comparison approach.
R4	Evaluation Bias Risk	Researcher interpretation may influence framework scoring decisions.	Qualitative evaluation involves human judgement.	The proposed model may produce subjective results.	Medium	High	High	Use transparent scoring rules supported by evidence and literature.	Include limitations and recommend expert validation.
R5	Data Quality Risk	Some online AI governance information may lack reliability.	Availability of non-academic or unofficial AI resources.	Incorrect conclusions and reduced research credibility.	Low	High	Medium	Prioritise peer-reviewed research, government documents, and recognised standards.	Remove unreliable sources and replace them with verified references.
R6	Privacy Risk	Incorrect interpretation of privacy requirements may affect governance evaluation.	Complexity of privacy laws and AI data management requirements.	Evaluation model may not adequately address data protection needs.	Medium	Medium	Medium	Review Australian Privacy Principles (APPs), privacy guidance, and responsible AI principles.	Update privacy evaluation criteria based on regulatory requirements.
R7	Ethical Risk	AI governance frameworks may not sufficiently address fairness, transparency, or accountability.	Different frameworks provide different levels of ethical guidance.	Proposed model may overlook important responsible AI principles.	Medium	High	High	Include ethics, fairness, transparency, and accountability as evaluation criteria.	Add additional ethical indicators during model refinement.

Appendix D

RACI Matrix

R= Responsible

A=Accountable

C= Consulted

I= Informed

Activity	Bishal	Academic Supervisor	Cyber Expert	Privacy Expert	Pilot Representative	User Reviewer
Build browser prototype	A/R	I	C	C	I	I
Prepare evaluation protocol	R	A	C	C	C	C
Conduct expert review	A/R	I	R	R	C	I
Conduct scenario pilot	A/R	C	C	C	R	C
Analyse feedback and refine artefact	A/R	C	C	C	C	C
Approve final academic submission	R	A	I	I	I	I
Publish portfolio and handover	A/R	C	I	I	I	I
Confirm scope and success criteria	R	A	C	C	C	I
Update evidence and control library	A/R	C	C	C	I	I
Design questionnaire and mapping	A/R	C	C	C	C	I
Define maturity scoring and gates	A/R	C	C	C	I	I

Appendix E

AI Use Statement

Tools and purpose: Claude and ChatGPT assisted in organising the proposal's structure, reviewing its clarity, suggesting categories for stakeholders and project risk, supporting the creation of diagrams, and providing a starting code Skelton for the browser prototype. My assessment 1 research, topic brief, and assessment 2 pitch work served as the basis for the evidence themes, project gap scope selections, maturity model choices, and final recommendations. I have also used ai tools like Gemini to create a clear diagram. I have used chat GPT for the instructions to how to create and modify my assignment and the diagram and codes.

For Sample prompts: I have used AI to check whether my words or paragraph are aligning together with the clear content with the assignment and if the grammars in my assessments are correct. Also, to conduct a clear and visible workflow with the matching rubric for the assessment.

Verification: The original academic article or the pertinent official website was consulted for references and factual statements. Repeatable scenario tests and human computations will be used to verify the score logic. The final project scope was compared to the diagram labels, project dates, and risk treatments.

Overall, AI was used to create clearer diagram and for more deep research to greave a good report following every steps.

Weekly Preparation Milestones

Week	What You Should Have Ready by End of Week	Why This Matters for Assessment 3
5	• Assessment 1 submitted. • Project Confirmation Form completed and approved. • Project scope refined based on Assessment 1 findings. • SMART objectives, research questions, and initial project charter prepared. • Key AI governance frameworks identified (<i>NIST AI RMF, ISO/IEC 42001, EU AI Act, Australian AI Guidance</i>).	Foundation – Locks in project scope and direction. Ensures Assessment 3 extends Assessment 1 by transforming the identified research gap into a practical project proposal.

6	• Methodology section drafted (~500–600 words). • Design Science Research methodology selected. • Work Breakdown Structure (WBS), Gantt chart, project milestones, resource requirements, and initial risk register completed.	Project Planning & Methodology – Contributes significant marks. A clear research method, timeline, and risk approach demonstrate project feasibility and professional project management capability.
7	• Ethics, privacy, and responsible AI sections completed (~400–600 words). • Responsible AI principles analysed. • Australian Privacy Principles (APPs), transparency, accountability, fairness, human oversight, and AI security considerations included.	Responsible AI & Impact – Provides evidence of responsible AI consideration. These sections demonstrate awareness of ethical, legal, privacy, and sustainability impacts of AI governance adoption.
8	• Assessment 2 pitch completed. • Panel feedback documented. • Three key improvements identified and incorporated into Assessment 3. • Stakeholder analysis and communication plan completed. • Proposed Comparative AI Governance Framework Evaluation Model refined.	Feedback Integration – Panel feedback is valuable evidence of project improvement. Assessment 3 is assessed partly on the ability to respond to feedback and strengthen the proposed solution.

9	• Complete draft of Assessment 3 prepared (all required sections completed). • Public GitHub repository created with README, project artefacts, diagrams, evaluation matrix, and documentation. • Full risk register finalised. • AI Use Statement completed. • Peer review conducted.	Quality Assurance – Final revision opportunity before submission. Ensures the report, repository, diagrams, and supporting materials satisfy all assessment requirements and improve overall quality.
10	• Final proofreading completed. • Peer review comments integrated. • Harvard referencing checked. • Formatting, diagrams, appendices, GitHub repository, and AI Use Statement verified. • Final submission uploaded before deadline.	Submission Week – Ensures the final proposal is complete, professionally presented, academically compliant, and ready for assessment.
